

Open Science & FAIR

Introduction to Data Management Practices course

NBIS DM Team

data@nbis.se

Open Science

Make scientific research and its dissemination accessible to all levels of society.

- Open methodology
- Open source
- Open data
- Open access
- Open peer review
- Open educational resources

Reasons for Open Science

What do you think are reasons for Open Data?

Open Data

- Democracy and transparency
 - Publicly funded research data should be accessible to all
 - Published results and conclusions should be possible to check by others
- Research
 - Enables others to combine data, address new questions, and develop new analytical methods
 - Reduce duplication and waste
- Innovation and utilization outside research
 - Public authorities, companies, and private persons outside research can make use of the data
- Citation
 - Citation of data will be a merit for the researcher that produced it

Ethical?

Doing "sloppy" science & not being open and transparent

Waste of resources
Contributing to the current research credibility crisis
Contributing to the current reproducibility crisis

Harming the profession

Harming public trust in research

Crisis?

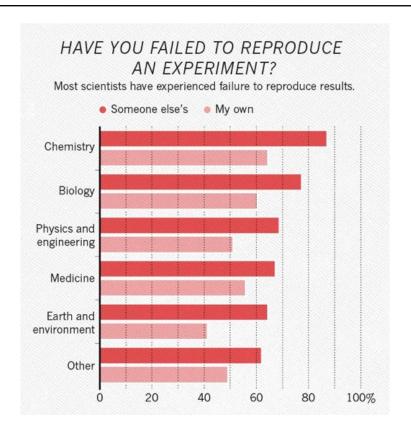

Do you think we have a credibility and/or reproducibility crisis?

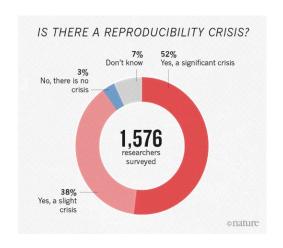

If so, what are some of its causes?

A reproducibility crisis

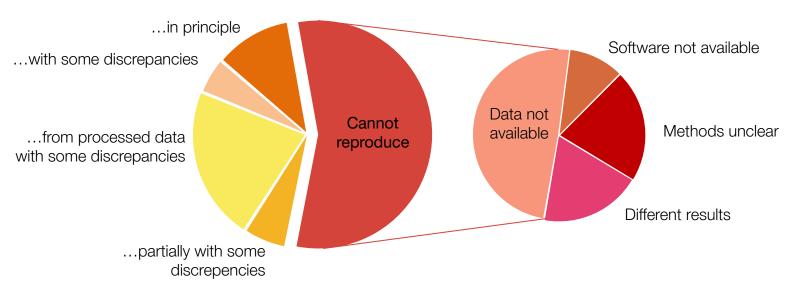

A reproducibility crisis

Reproduction of data analyses in 18 articles on microarray-based gene expression profiling published in Nature Genetics in 2005–2006:

Can reproduce...

Summary of the efforts to replicate the published analyses.

Adopted from: loannidis et al. Repeatability of published microarray gene expression analyses. *Nature Genetics* **41** (2009) doi:10.1038/ng.295

FAIR

- To be useful for others data should be
 - FAIR Findable, Accessible, Interoperable, and Reusable
 ... for both Machines and Humans

Wilkinson, Mark et al. "The FAIR Guiding Principles for scientific data management and stewardship". Scientific Data 3, Article number: 160018 (2016) http://dx.doi.org/10.1038/sdata.2016.18

Box 2 | The FAIR Guiding Principles

To be Findable:

- F1. (meta)data are assigned a globally unique and persistent identifier
- F2. data are described with rich metadata (defined by R1 below)
- F3. metadata clearly and explicitly include the identifier of the data it describes
- F4. (meta)data are registered or indexed in a searchable resource

To be Accessible:

- A1. (meta)data are retrievable by their identifier using a standardized communications protocol
- A1.1 the protocol is open, free, and universally implementable
- A1.2 the protocol allows for an authentication and authorization procedure, where necessary
- A2. metadata are accessible, even when the data are no longer available

To be Interoperable:

- 11. (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation.
- 12. (meta)data use vocabularies that follow FAIR principles
- 13. (meta)data include qualified references to other (meta)data

To be Reusable:

- R1. meta(data) are richly described with a plurality of accurate and relevant attributes
- R1.1. (meta)data are released with a clear and accessible data usage license
- R1.2. (meta)data are associated with detailed provenance
- R1.3. (meta)data meet domain-relevant community standards

Findable

- Data have a globally unique persistent identifier
 - o e.g. a DOI, database accession number, etc
- Data are described by metadata
 - Information that explains the data
- Data and metadata are findable in a search resource
 - There must be ways of searching for the data

Accessible

- Data is retrievable through a standardised communication protocol (open, free, allowing authentication & authorisation where necessary)
 - e.g. http, sftp, etc
- Metadata are accessible, even if data is no longer available
 - Information about the data can be found even if data is no longer available

Interoperable

- Metadata use a formal, accessible, shared language for knowledge representation
 - Metadata is available in a form that even a computer can make use of
- Metadata use vocabularies that follow the FAIR principles
 - Standardised ways of capturing information about the data (that are in themselves FAIR)
- Metadata include qualified references to other metadata
 - If the data relies on other data, there must be links to those

Reusable

- Data have a clear data usage license
 - It is obvious under what conditions the data can be reused
- Metadata are associated with detailed provenance
 - The metadata is detailed enough to understand for what research questions it is relevant to reuse
- Metadata meet domain-relevant community standards
 - Metadata is described according to existing standards in the research field

FAIR

- Both humans and machines are intended users of data
- The principles are not necessarily about open data
 - "As open as possible, as closed as necessary"
- FAIRness is not something absolute
 - Different levels of FAIR maturity
- FAIR does not enforce any particular technical standards

When to be FAIR?

FAIR at source?

Retroactively?

Good Data Management Practices V SciLifeLab

- Data Management Plans, to do your thinking ahead of time
- **Using standard metadata descriptions**, to clearly define your data
- Organising your analysis, so you and others can understand what you have done
- **Use versioning control** to keep track of changes you do
- Clean up metadata and data to be consistent with the standards you have chosen
- Submit your data to international public repositories, so others can find and reuse your data
- Use scripted analysis of your data, that can be understood by others

The Political landscape

Strong international movement towards Open Science

- European Commission recommended the member states to establish national guidelines for Open Access
 - Swedish Research Council (VR) submitted proposal to the government Jan 2015
- Research bill 2017–2020 28 Nov 2016
 - "The aim of the government is that all scientific publications that are the result of publicly funded research should be openly accessible as soon as they are published. Likewise, research data underlying scientific publications should be openly accessible at the time of publication." [my translation]
- 2018 VR assigned by the government to coordinate national efforts to implement open access to research data

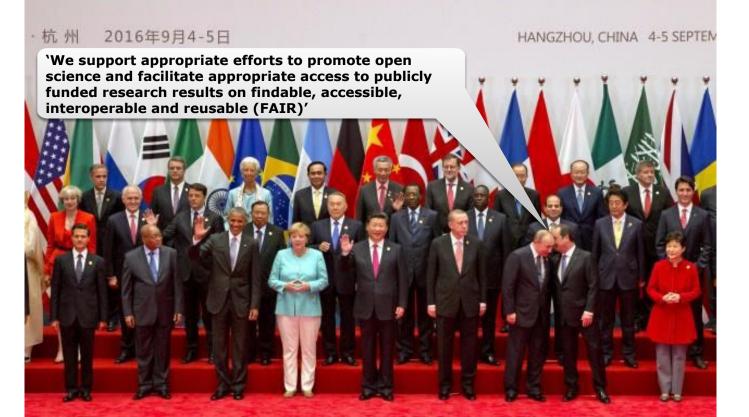

The Political landscape

G20 HANGZHOU SUMMIT

EOSC

EUROPEAN OPEN SCIENCE CLOUD

The EOSC will offer 1.7 million European **researchers** and 70 million professionals in science, technology, the humanities and social sciences a virtual environment with **open and seamless services for storage**, **management**, **analysis and re-use of research data**, across borders and scientific disciplines by federating existing scientific data infrastructures, currently dispersed across disciplines and the EU Member States.

"Open Data Directive"

- <u>Directive (EU) 2019/1024</u> of the European Parliament and of the Council of 20 June 2019 on open data and the re-use of public sector information
- To be implemented into national member state laws by 16 July 2021

"EU countries must adopt policies and take action to make **publicly funded research data openly available**, following the principle of '**open by default**' and support the dissemination of research data that are findable, accessible, interoperable and reusable (the '**FAIR' principles**)"
